

XL Logic Installation

Requirements

- Minecraft 1.21.1
- NeoForge 21.1.218
- Java 21

XL Logic must be installed on both the client and the server when you want to use it in multiplayer.

Release artifact

When building from source, the installable bundled artifact is:

- `build/libs/xllogic-<version>.jar`

The plain project jar is kept as a slim development artifact:

- `build/libs/xllogic-<version>-slim.jar`

For normal installation and distribution, use the bundled jar without the `-slim` suffix.

Build from source

On Windows:

```
Set-Location "D:\projet\XLLogic"  
.\gradlew.bat clean jarJar
```

On macOS or Linux:

```
cd /path/to/XLLogic  
./gradlew clean jarJar
```

Client installation

1. Install Minecraft 1.21.1 with NeoForge 21.1.218.
2. Build or download the bundled release jar.
3. Copy `xllogic-<version>.jar` into the client's `mods` folder.
4. Start the game with Java 21.

No separate Python installation is required. GraalPy is bundled into the release jar.

Dedicated server installation

1. Install a NeoForge 21.1.218 server for Minecraft 1.21.1.
2. Copy the same bundled `xllogic-<version>.jar` into the server `mods` folder.
3. Start the server with Java 21.
4. Let the server generate its config files once.

After first launch, XL Logic server-side settings will be available through the generated config files, including runtime guardrails.

Multiplayer note

- The server and all joining clients must use the same XL Logic version.
- If the server has XL Logic installed, clients also need it.
- If the client has XL Logic but the server does not, treat that as an unsupported setup for normal play.

Troubleshooting

- If the game or server fails to start, verify that you are on Java 21.
- If the mod is present but Python features fail immediately, make sure you used the bundled jar and not the `-slim` jar.
- If client and server disagree on the mod version, fix the mismatch before testing further.
